GENE THROTION: IN COOPEARMION WITH OTHER CHAPERONES, HSP70S STABILIZE PREEXISSEMENT PROTEINS AGAINST AGGREGATION AND MEDIATE THE POLDING OF NEMLY TRANSLATED POLYPERTIDES IN THE CYTOSOL AS WELL AS WITHIN ORGANIZLES. THESE CHAPERONES PRATICIPARE IN ALL THESE PROCESSES THROUGH THEIR ABILITY TO RECOGNIZE MONATIVE CONFORMATIONS OF OTHER PROTEINS. THEY BAND EXTRADED PETTIDE SEMENTS WITH A NET HYDROPHOBIC CHARACTER EXPOSED BY POLYPERTIDES DURING TRANSLATION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            #17979; 061689;

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
